

# CoinRecycler Roadmap and Features

# CoinRecycler Anonymization Process

**Many developers claim to be working on anonymous transactions, but only CoinRecycler can actually fully guarantee anonymity.**

**Our special process removes all the complexity that other anonymization methods force on the user. It allows anyone, anywhere, to create anonymous transactions with any coin.**

**Additionally, our anonymization process goes beyond the blockchain, which no other coin has done before. Our cross-blockchain transaction anonymization increases anonymity beyond what is possible for any individual coin to do.**

**The basic process, step by step:**

- **Incoming coins are combined, mixed, and sent out to multiple exchanges in random quantities**
- **Coins are traded on exchanges, converted to BTC and then MAST**
- **For extra anonymity, MastiffCoins can be optionally mixed again and randomly delayed for ultra-anonymous transactions to avoid time-based statistical grouping analysis**
- **Outgoing MastiffCoins can be sent to yourself or any 3<sup>rd</sup> party recipient, in as many smaller transactions of random quantities as desired**

**Any statistical or forensic analysis of the original coin's blockchain is broken by going across multiple coins, multiple exchanges, and optionally being mixed again and paid out at random times in random quantities.**
